

Skiful Technologies, LLC

Modernization for regulated systems | Capability statement

We help agencies and their prime contractors modernize legacy applications, records workflows, identity, and data platforms through bounded assessments and clearly scoped delivery.

CORE CAPABILITIES

Applications and records: case and lifecycle workflows, legacy modernization, document intake with validation and human review.

Identity and platforms: SAML/OIDC federation, role-based access, AWS, Terraform, Kubernetes, and monitoring.

Data and integrations: ETL, PostgreSQL, Redshift, and REST/GraphQL integrations.

SELECTED PRINCIPAL EXPERIENCE

The following work was delivered by our principals in previous roles, rather than under contracts held by Skiful Technologies, LLC.

GSA / USAi.gov: identity federation across 27 agency tenants, an operations portal, monitoring across 25 cloud accounts, and reduction of the outstanding vulnerability backlog to zero.

CMS / BEDAP: more than 15 ETL sources consolidated and served to consumer teams through REST and GraphQL.

CMS / MCADS: over 25,000 documents converted in support of claims-system modernization, with mechanically checked citation traceability.

Attention IT / eMWaste: regulated hazardous-waste tracking for national laboratories, rewritten from Oracle Forms onto a modern web stack.

START WITH A BOUNDED ASSESSMENT

One application or workflow: integration map, business-rule inventory, prioritized risks, and a recommended first implementation increment with acceptance criteria. Access, staffing, fixed fee, schedule, and exclusions are agreed in the proposal.

For primes: defined modernization, identity, and data work packages. Subsequent implementation and ongoing support are scoped separately.

DELIVERY LEAD

Delivery lead and any additional specialists are named in the engagement proposal, with their roles and availability confirmed.
